==========

SCHOOL MANAGEMENT SYSTEM

PROJECT DESCRIPTION REPORT (REPORT 1)

==========

1. Project Title and Business Idea

- Project Title: School Management System

- Business Idea: A comprehensive school information system designed to automate and manage core administrative and academic operations, including student records, teacher profiles, course catalogues, and student enrollments.

2. Problem Statement and Purpose

- Problem Statement: Traditional or manual record-keeping in schools often leads to data redundancy, tracking errors in course enrollments, difficulties in managing teacher-course allocations, and inefficiencies in grade management.

- Purpose: The purpose of this system is to provide a structured, centralized platform that accurately models academic entities and their relationships, streamlining data management and improving the accuracy of academic tracking.

3. Project Scope (Covered & Excluded)

- Functions Covered:

  * Managing student personal records and academic history.

  * Maintaining teacher profiles, specializations, and schedules.

  * Creating and managing course details and credit units.

  * Processing and tracking student course enrollments and status.

- Functions Excluded:

  * This project focuses strictly on the system analysis and UML class diagram design phase; the development of a fully functional software application, user authentication security layers, and payment gateways are excluded from the current scope.

4. Main Classes and Their Responsibilities

- Student: Represents individual learners enrolled in the institution, responsible for registering courses and viewing grades.

- Teacher: Represents academic staff members responsible for teaching courses and assigning student grades.

- Course: Represents individual academic subjects or modules offered by the school, defining credit values.

- Enrollment: Acts as an association/transaction class capturing the specific registration link between a student and a course, tracking dates and statuses.

5. System Requirements Overview

- Functional Requirements: The system must allow students to register for courses, teachers to assign grades, and administrators to maintain course details and enrollment statuses.

- Non-Functional Requirements: Data consistency, structural clarity, adherence to standard UML modelling conventions, and clear class relationships.

-
